

Supercharge Your Data, Analytics, and Insights Pipeline in the Cloud

About NETSOL Cloud Services Data Offerings

NETSOL, a leading data management solutions provider, specializes in data governance, engineering, and architecture. Our team collaborates with clients to design roadmaps, assess processes, and identify improvements. Services include building Data Asset registers, creating Enterprise Data Models, and designing end-to-end data architectures for various models, ensuring future-proof solutions. We also optimize data pipelines, design custom BI Dashboards, and enhance ETL performance, delivering tailored consulting and professional services for data-driven success.

Benefits

- » Resources equipped with extensive knowledge of AWS designed framework for Cloud Adoption and Architecture Review
- » Experts in assessing and transforming legacy applications to modern architecture
- » Build and design data quality and standards that leads to trustworthy data
- » A robust delivery model to support augmentation facilities for all
- » Gain tangible business benefits with AWS data insights

Data-driven insights can bring you reduced operational costs and make your organization more competitive and resilient with Amazon Web Services (AWS)

Convert siloed, disparate data to rich insights

It can be a heavy lift to ensure that you are on top of your analytics game. Data is often of different types or siloed. Storing and processing it into usable analytics can be slow and costly. AWS not only addresses these issues, but also offers you further advantages. Irrespective of the condition of your data or staffing situation, AWS solutions help you collect, consolidate, and clean your data so that you can identify patterns and predict outcomes to beat the competition.

Leverage industry expertise, and speed time to insight

AWS brings you access to established experts with a proven track record in helping small and medium-sized businesses with all their analytics needs. They cover everything from evaluating and using tools, to best practices for collecting, storing, governing, and analyzing data. In short, you gain immediate access to expertise it would take years to build in-house. All of this, with bundled security and resiliency architected from the ground up, can provide up to 69 percent reduction in unplanned downtime and fewer security incidents. Predictive and Machine-Learning (ML) powered analytics and Artificial Intelligence (AI) technologies add more value, helping you to uncover hidden insights and trends in your data, identify key drivers, and forecast business metrics. Being on AWS reduces time to run queries by 79 percent and increases the number of queries by 37 percent. The native integration that AWS has between all the layers of the analytics stack, enables a quick analysis of data using any approach. The underlying infrastructure is managed by AWS, so that you can focus solely on your application and gain business insights faster.
